

Linear and Nonlinear Climate Response

Robbin Bastiaansen
TiPES GA, 2022-09-15

Climate Response

The change in observable due to climate forcing (e.g. CO₂)

Equilibrium Climate Sensitivity (ECS)

change in equilibrium temperature
due to (instantaneous) doubling of CO₂

Transient Climate Response (TCR)

change in temperature after 100 years
with 1% CO₂ increase per year (until doubling)

Methodology

- DESIGN experimental protocol for GCM
- FIT resulting time series to simple model
- EXTRAPOLATION using simple model

Linear Response

$$\frac{dO}{dt} = \mathcal{L} O + g(t)$$

Evolution of temperature

$$\Delta T(t) = (G * g)(t) = \int_0^t G(s) g(t-s) ds$$

Green Function

forcing

Approximation of Green Function:

$$G(t) = \sum_{m=1}^M \beta_m e^{-t/\tau_m}$$

Gregory Method

Regress data to

$$\Delta N(t) = \mathbf{F} + \lambda \Delta T(t)$$

Since $\Delta N_* = 0$ in equilibrium,
ECS estimation is

$$\Delta T_*^{est} = -\lambda^{-1} \mathbf{F}$$

Gregory Method

Regress data to

$$\Delta N(t) = F + \lambda \Delta T(t)$$

Since $\Delta N_* = 0$ in equilibrium,
ECS estimation is

$$\Delta T_*^{est} = -\lambda^{-1} F$$

Gregory Method

Regress data to

$$\Delta N(t) = F + \lambda \Delta T(t)$$

Since $\Delta N_* = 0$ in equilibrium,
ECS estimation is

$$\Delta T_*^{est} = -\lambda^{-1} F$$

Gregory Method

Regress data to

$$\Delta N(t) = F + \lambda \Delta T(t)$$

Since $\Delta N_* = 0$ in equilibrium,
ECS estimation is

$$\Delta T_*^{est} = -\lambda^{-1} F$$

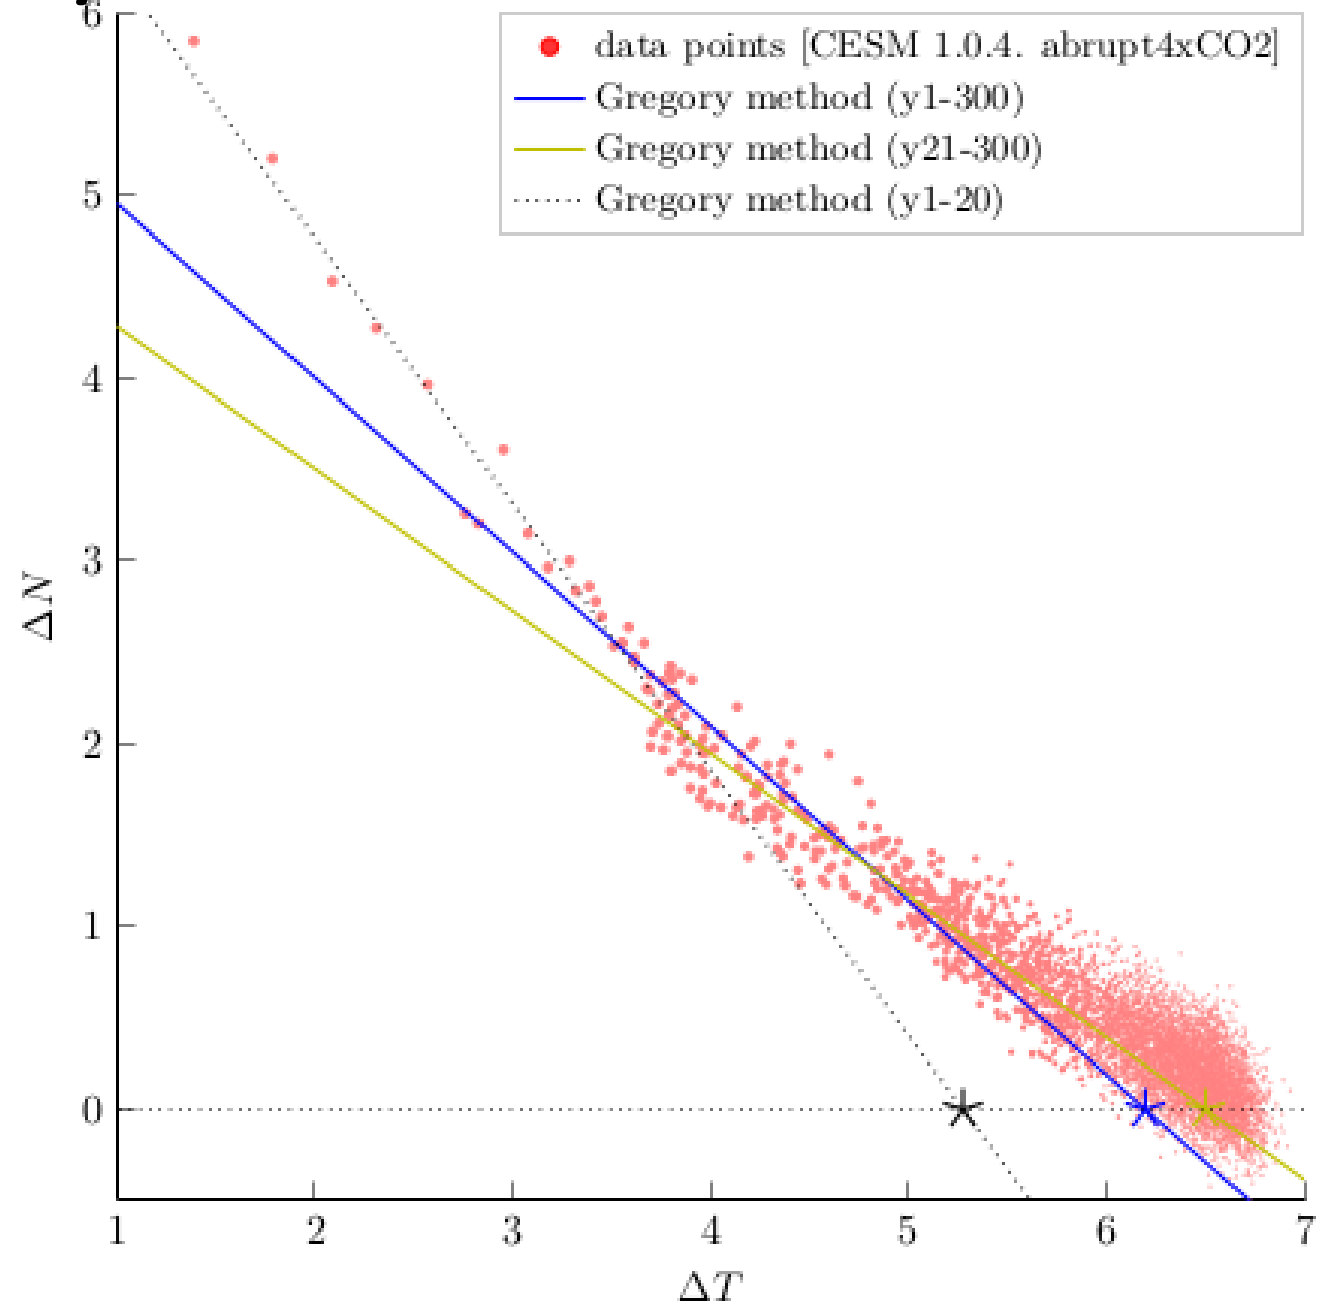

Gregory Method

Regress data to

$$\Delta N(t) = F + \lambda \Delta T(t)$$

Since $\Delta N_* = 0$ in equilibrium,
ECS estimation is

$$\Delta T_*^{est} = -\lambda^{-1} F$$

Gregory Method

Regress data to

$$\Delta N(t) = F + \lambda \Delta T(t)$$

Since $\Delta N_* = 0$ in equilibrium,
ECS estimation is

$$\Delta T_*^{est} = -\lambda^{-1} F$$

New Multicomponent Linear Regression Method

Use additional observables!

Regress to:

$$\overrightarrow{\Delta Y} = \mathbf{A} \overrightarrow{\Delta X} + \overrightarrow{\mathbf{F}}$$

$\overrightarrow{\Delta Y}$:

observables that
tend to 0
in equilibrium

$\overrightarrow{\Delta X}$:

observables that
get estimated
in equilibrium

Multivariate ECS estimation is

$$\overrightarrow{\Delta X}_*^{est} = -\mathbf{A}^{-1} \overrightarrow{\mathbf{F}}$$

New Multicomponent Linear Regression Method
